

THE SMS FACTORY

Quick Start Guide

Nov 2014

This is a quick guide to test the API and have a grasp of the basics of creating message campaigns using TheSmsFactory. For a more detailed explanation, please check our latest API Reference and Code Examples at <http://www.thesmsfactory.com/Desarrolladores/>.

Sending SMS messages using TheSmsFactory's API is as easy as following these steps. It is even possible to making the calls using a standard Web Browser and noting down the results (*for test purpose only!*):

1. - Create an User Account on our website

<http://www.thesmsfactory.com/Envio/login.aspx>

These are the credentials you will need for all future API calls.

2. - Create a new Campaign

<http://www.thesmsfactory.com/Envio/api.ashx?command=CREATECAMPAIGN&userEmail=###&password=####&campaignName=####&senderName=####>

Simply add your password and email to the above link, and chose a Campaign Name and a Sender. This call will return (if correct) the Campaign Id that will be used in the next steps.

3. - Add a Message to the Campaign

<http://www.thesmsfactory.com/Envio/api.ashx?command=ADDMESSAGE&userEmail=####&password=####&campaignId=00000000-0000-0000-0000-000000000000&messageText=####&phoneNumber=####>

Using your credentials and the previously obtained Campaign Id (instead of the Zeroes chain), specify a Message and the number to send it to.

4. - Finish the Campaign and send it

<http://www.thesmsfactory.com/Envio/api.ashx?command=WRAPUP&useremail=####&password=####&campaignId=00000000-0000-0000-0000-000000000000>

Finally, we tell the system that the campaign is finished and ready to be sent. After this call, the message should be received at the specified number moments later.
